

Chiropractic adjustments shown to reverse autism in three-year old

Nachmias
Chiropractic

A recent case study reported in the *Annals of Vertebral Subluxation Research* suggests that chiropractic adjustments can help reverse and prevent autism, and other issues related to the autism spectrum. The patient in this case, was an adopted three-year-old who was born at 28 weeks, weighing 2 pounds and 5 ounces by a woman who had a history of prior drug abuse. After two years of abnormal behavior and receiving multiple "autism" diagnoses from medical doctors, the child's parents decided to take him in for a thorough developmental evaluation. Five critical items were failed: social/emotional, communication, cognitive, adaptive/self-help and sensory.

The Little Child's Life Changed by Chiropractic

The child's parents brought him to a local chiropractor, presenting with a cocktail of horrible symptoms including common neurological autism manifestations, unrelenting headaches, acid reflux, vomiting, sleeplessness and seizures. Subluxation-based specific chiropractic care was performed on the patient, which resulted in complete resolution of her headaches, acid reflux, vomiting and sleeplessness within one month. Significant improvements in autism-related issues were also noted, including calm behavior,

increased eye contact, happier demeanor, improved attitude, increased focus and attention, and an initiation to sound out words. The study reports that the child continues to progress as evidenced by a significantly increased vocabulary, continued improvement in attention and focus, and complete lack of epileptic episodes.

Vertebral Subluxation

"Finding the cause of autism, and not simply masking the symptoms, is the most effective way of managing the disease," one author of the study says. One such risk is thought to be spinal misalignments and/or abnormal motion of the spine, termed "vertebral subluxations" by chiropractors, which result in structural and neurological interference to the spine and nervous system. It is this interference that may cause a cascade of neuroendocrine events that lead to abnormal cholesterol metabolism. The theory is that, once those spinal distortions are corrected, the body is better able to balance its physiology. Learn more:
